Landfill Gas Combustion System is a system designed to capture and burn gases, primarily methane, that are emitted from landfills. The system typically involves the collection of landfill gas through a network of wells and pipes, which is then transported to a combustion unit where it is either flared or used to generate energy. This process helps reduce the environmental impact of methane, a potent greenhouse gas, by either safely disposing of it through controlled combustion or converting it into electricity or heat, contributing to renewable energy production. The system is an essential part of landfill gas management, aiming to mitigate pollution and harness energy from waste.
