The global Landfill Gas Flare System market size is predicted to grow from US\$ 4516 million in 2025 to US\$ 5644 million in 2032; it is expected to grow at a CAGR of 3.3% from 2026 to 2032.

Landfill Gas Flare System is a setup designed to safely burn off landfill gas (LFG), which is primarily composed of methane and carbon dioxide, produced from the decomposition of organic waste in landfills. The flare system helps to prevent the release of harmful gases into the atmosphere, reducing environmental and safety risks such as explosions, odors, and greenhouse gas emissions. Typically, the system includes components such as gas collection wells, pipelines, and a flare stack, where the collected landfill gas is combusted at high temperatures. This process also serves to convert the methane into carbon dioxide, which has a lower global warming potential.

United States market for Landfill Gas Flare System is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
