The global Lanthanum Chloride market size is predicted to grow from US\$ 34.43 million in 2025 to US\$ 47.49 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

In 2025, global Lanthanum Chloride production reached approximately 19.6 k tons, with an average global market price of around US\$1,796 per ton. Lanthanum Chloride (LaCl_3) is an inorganic white, crystalline salt that is highly soluble in water and alcohol, widely used as a phosphorus binder in water treatment, a catalyst in organic synthesis, and a precursor for creating other lanthanum compounds. It is commonly used to remove phosphate from swimming pools, spas, and aquariums, and is often available as a heptahydrate form.

From a supply-demand perspective, the lanthanum chloride market behaves more like a rare-earth salt intermediate than a standalone end-product market. Demand is supported by a combination of refining catalysts, water treatment, downstream lanthanum compounds, and high-purity anhydrous materials, rather than by one single application. China's standard system recognizes solid and liquid products, different purity grades, and applications in catalysts and environmental materials, indicating that the market places strong emphasis on product consistency, purity, impurity control, and delivery form. On the supply side, the industry is constrained by rare-earth resources, separation quotas, environmental compliance, and purification capability. China remains an important global supply base, while overseas demand increasingly values localized supply, high-purity specifications, and application support. Future growth is expected to come mainly from environmental treatment, catalyst replacement demand, and high-purity material use, although commodity-grade products will remain exposed to light rare-earth price cycles, mixed rare-earth chloride substitution, and downstream formulation changes.
