Lanthanum hexaboride filaments (LaB6 Cathodes) are electron emission filaments made of lanthanum hexaboride (LaB6) material. They are a special electron emission material with significant performance advantages. They are mainly used in electron optical systems such as electron microscopes (such as scanning electron microscopes SEM, transmission electron microscopes TEM). Compared with traditional tungsten filaments, they have higher electron emission efficiency and longer service life. Lanthanum hexaboride filaments are widely used in SEM, TEM, X-ray, electron beam lithography and other fields. In these fields, lanthanum hexaboride filaments are highly favored for their high brightness, long life and stable performance. LaB6 filaments installed on commercial SEM and TEM generally have a continuous working life of more than 6 months in a good vacuum environment (such as the vacuum degree of the electron gun is better than  $10^{-7}$  torr).

The global Lanthanum Hexaboride Filament market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
