RAM is a common abbreviation in computers, standing for Random-Access Memory. It is sometimes referred to as PC memory or simply memory. Essentially, RAM is the short-term memory of a computer or laptop. It stores the data that the computer processor needs to run applications and open files. RAM only holds the data needed for currently open applications and files. When you close an application or shut down the computer, the data is cleared from RAM. Laptop memory refers to the memory chip module installed on the motherboard of a laptop computer, which is used to store programs and data needed during the operation of the computer. It is also a type of internal memory, which is opposite to external memory (such as hard disk), and undertakes the function of temporary storage and quick access of computer data.
