Random access memory, also known as "random access memory", is an internal memory that exchanges data directly with the CPU, also called main memory (memory). It can be read and written at any time, and is fast, often acting as a temporary data storage medium for operating systems or other running programs.

The contents of the storage unit can be freely taken out or stored as needed, and the speed of access is independent of the location of the storage unit. Such a memory will lose its stored content when it is powered off, so it is mainly used to store programs for short-term use.
