The global Large-diameter High-pressure Reinforced Composite Lay-Flat Hose market size is predicted to grow from US\$ 358 million in 2025 to US\$ 683 million in 2032; it is expected to grow at a CAGR of 9.6% from 2026 to 2032.

Large-diameter high-pressure reinforced composite lay-flat hose refers to a flexible, reelable and collapsible surface water-transfer hose used in shale oil and gas hydraulic fracturing operations. It transfers fresh water, produced water, recycled water or blended water from water sources, pits, tanks or temporary water-treatment facilities to well pads or frac water supply systems. The hose is typically constructed with TPU, NBR/PVC, rubber or other thermoplastic composite inner and outer layers, reinforced by circular-woven high-tenacity polyester, aramid or other synthetic fibers. It is designed for high-flow, moderate-to-high pressure, abrasion-resistant, low-elongation and rapidly deployable field water-transfer applications. The drilling process of hydraulic fracturing is a process that requires a lot of water. Public attention to this process (also known as fracking) is mainly focused on the mixture of water and chemicals injected underground to break open rocks and release gas.

Shale oil and gas production has a huge demand for fracturing fluid. In the early stage, the downstream industry generally used special vehicles to transport fracturing fluid. Large-diameter high-pressure reinforced composite lay-flat hoses have realized the low-cost, fast and fully automatic laying of long-distance and large-flow delivery pipelines, which significantly reduced the cost of production and was an important factor in the commercial success of the shale gas revolution.
