Ultrasonic heat meters are instruments that measure the flow rate and display the heat energy released or absorbed by the water flowing through the heat exchange system by means of ultrasonic waves. It obtains the calorific value through the physical quantities measured by the two sensors - the flow rate of the heat carrier and the temperature of the inlet and outlet, and then through the compensation and integral calculation of the density and enthalpy values. It is a mechatronics product based on microprocessors and high-precision sensors.
