Abstracts

The global Large Plastic Injection Molds market size is predicted to grow from US\$ 3924 million in 2025 to US\$ 7281 million in 2032; it is expected to grow at a CAGR of 10.0% from 2026 to 2032.

Large injection molds are used to mold large-volume, large-projection-area, or complex-structured plastic parts (such as car bumpers, appliance housings, trash cans, and logistics pallets) on high-clamping-force injection molding machines. Their core components include the mold base, cavity and core, gating system (hot runner/cold runner), core-pulling and sliding block mechanism, ejection system, cooling circuit, and sensors and detection. Compared to small and medium-sized molds, large molds emphasize rigidity and thermal management, uniform filling and warpage control, and high-reliability cycle stability. They enable the molding of large-size/high-appearance-quality/high-efficiency structural parts, significantly reducing cracking and warpage, improving consistency and yield, shortening molding cycles, and reducing overall manufacturing costs (energy consumption, labor, and scrap rate). The average price of a large injection mold is approximately US\$35,000 per set, with global sales of approximately 114,000 sets. Prices vary significantly depending on size, number of cavities, runner system, and materials.

The market landscape for large injection molds exhibits a close upstream-downstream linkage: the upstream relies on high-performance mold steels (such as P20, H13, 1.2738, S136), advanced hot runner systems (needle valve/open type, 4–64 points), five-axis and large gantry machining capabilities, and flow and warpage simulation technology; the downstream is widely used in the automotive, home appliance, logistics packaging, and new energy vehicle casing industries, requiring 1,000–4,500 ton injection molding machines with cycle times between 20–120 seconds. Future

development trends focus on digitalization (DOE, CAE, sensors), rapid mold changeover and standardized modules, needle valve hot runners and zoned pressure holding to improve the quality of exterior parts, while combining recyclable materials (PP, HDPE recycled materials, PC/ABS alloys) to optimize flow and cooling. The Asian region, with its advantages in production capacity and delivery speed, has become a competitive focal point, with complete line delivery and simultaneous mold manufacturing processes becoming increasingly favored by the market.
