Large regeneration gas heater are high-power industrial heating devices designed for large-scale regeneration of adsorption systems (such as molecular sieves, zeolite wheels, and activated carbon). Using a heat source such as electricity, steam, or gas, they heat large volumes of gas (air or inert gas) to high temperatures (typically 180-400°C) to remove moisture, VOCs, or other pollutants trapped in the adsorbent and restore its adsorption capacity. Key features include high power (typically hundreds to thousands of kW), high air volume handling capacity, high-temperature output, and a high level of system integration, meeting the needs of continuous industrial-scale applications. By 2025, the production volume of large regeneration gas heater will reach approximately 800 units, with an average global market price of approximately $250,000 per unit.

United States market for Large Regeneration Gas Heater is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
