The global Large-scale Direct Air Capture (DACs) Facilities market size is predicted to grow from US\$ 458 million in 2025 to US\$ 970 million in 2032; it is expected to grow at a CAGR of 11.5% from 2026 to 2032.

Direct Air Capture (DAC) refers to a set of technologies designed to remove carbon dioxide (CO₂) directly from the atmosphere and either store it or use it for various purposes. As the global community seeks solutions to mitigate the effects of climate change, large-scale DAC facilities have become an increasingly important tool in the fight against global warming. Unlike traditional carbon capture, which captures CO₂ directly from industrial emissions, DAC facilities capture CO₂ that has already been released into the atmosphere, making them a potential way to address historic emissions and reduce the overall concentration of greenhouse gases in the air.

Carbon Dioxide, CO₂, is commonly found in natural gas. In order to meet pipeline specifications or other application specific requirements, CO₂ separation is necessary. In addition, there may also be H₂S and H₂O present that needs to be removed. CO₂ separation membranes have been widely used for CO₂ removal applications and come with the added benefit of removing H₂S and H₂O as well.
