The global Large-Scale Preparative SFC System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A Large-Scale Preparative SFC (Supercritical Fluid Chromatography) System is a specialized chromatographic system used for separating and purifying chemical compounds on a larger scale compared to analytical SFC systems. SFC is a chromatographic technique that utilizes supercritical fluids, typically carbon dioxide (CO₂), as the mobile phase instead of liquid solvents used in traditional liquid chromatography (LC). The preparative SFC system is equipped with high-capacity columns, robust pumps, and precise control systems designed to handle large quantities of sample material. It is employed primarily in pharmaceutical, chemical, and natural product industries for the isolation and purification of active pharmaceutical ingredients (APIs), natural products, and fine chemicals. These systems enable efficient separation of complex mixtures, offering advantages such as faster separation times, reduced solvent consumption, and the ability to process thermally labile compounds without degradation. Future developments in large-scale preparative SFC systems may focus on improving automation, scalability, and integration with other analytical techniques to meet the growing demand for efficient purification processes in drug discovery and chemical synthesis applications.

United States market for Large-Scale Preparative SFC System is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
