Large drum screen is a commonly used screening equipment in industries such as mining, building materials, and chemical engineering. It mainly consists of a sieve cylinder, a transmission device, a support device, a feeding device, a discharge device, etc. The working principle of a large drum screen is to screen materials through the rotating motion of the screen barrel. The material enters the inside of the sieve barrel from the feeding port, and due to the tilt angle and rotational motion of the sieve barrel, the material gradually moves forward inside the sieve barrel. During the movement, smaller particles fall into the lower discharge port through the sieve hole, while larger particles continue to move forward along the direction of the sieve barrel and are ultimately discharged from the discharge port at the other end of the sieve barrel. Large drum screens are widely used in industries such as mining, building materials, and chemical engineering. They can screen and classify stones, ores, coal, chemical raw materials, etc., improving production efficiency and product quality.
