Photolithography, also known as optical lithography or UV lithography, is a precision machining process for patterning features on thin films or substrates (also known as 'wafers'). Photolithography uses light to transfer geometric patterns from a photomask (also known as a 'reticle') to a light-sensitive (ie light-sensitive) chemical photoresist on a substrate. The exposed pattern is etched into the material through a series of chemical processes, or new material is deposited in the desired pattern on the material beneath the photoresist.
