The laser interferometer is a working reference instrument that uses laser wavelength to directly calibrate the linear scale. It uses a laser interferometer as a measuring scale and a photoelectric microscope as an aiming scale to measure and calibrate the linear scale. It is mainly used to calibrate first- and second-class standard metal linear scales and first- and second-class standard glass linear scales up to 1000 mm in length. In addition, it can also be used for the measurement and calibration of measuring instruments such as micrometers (100 lines/mm), displacement sensors, laser interferometers, low-grade linear scales and grating scales.
