A Laser Lipolysis System is a medical device that uses controlled laser energy to target and break down fat cells beneath the skin. It is a minimally invasive or non-invasive body contouring technology designed to melt localized fat deposits, tighten skin, and improve body shape. The laser's heat disrupts fat cell membranes, causing fat to liquefy, which is then naturally eliminated by the body's lymphatic system or suctioned out during a procedure. Additionally, the thermal effect stimulates collagen production, enhancing skin tightening in the treated area.
