The global Laser Liposuction Machine market size is predicted to grow from US$ 1039 million in 2025 to US$ 1604 million in 2031; it is expected to grow at a CAGR of 7.5% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The laser liposuction is used to more efficiently remove fat when compared to traditional liposuction. The fat is planned to be removed and is first infiltrated with a tumescent solution and then treated with a laser beam. The laser beam literally drills the fat cells thereby melting them. The process of melting them in essence allows for more uniform and comprehensive fat removal. The disadvantage of laser liposuction is that the fat is non-viable and cannot be used for fat transfer to areas such as the buttock, i.e. Brazilian Buttock Lift.
