Laser Methane Gas Detector is a device that detects gas concentration at a long distance. Users do not need to approach the detection point. The detector can emit laser to the detection point to measure the gas concentration between the detection point and the instrument. Generally, most distances are 50m/100m/150m, and the maximum can reach 200m or more.

Laser Gas Detector is mainly composed of optical and mechanical modules, signal processing modules, display and alarm modules and shell components. It measures the concentration of special gases based on the principle of tunable semiconductor laser absorption spectroscopy (TDLAS) technology. TDLAS technology is not affected by the surrounding detection environment, ensuring the high stability of the detection of specific gas concentrations. For example, laser methane detector can only detect the concentration of methane, avoiding the influence of the surrounding mixed gas concentration and achieving accurate detection.

The global Laser Methane Leakage Scanning Systems market size is projected to grow from US\$ 171 million in 2024 to US\$ 228 million in 2030; it is expected to grow at a CAGR of 4.9% from 2024 to 2030.
