The report requires updating with new data and is sent in 48 hours after order is placed.

This report focus on Laser Phosphor Display Technology market. Laser phosphor is a lamp less projection illumination technology that is using blue laser diodes as the primary light source. The laser phosphor technology is powered by a combination of laser diodes, mirrors and a phosphor screen. These diodes direct a laser signal to the mirrors and these lasers are then projected onto the phosphor screen, stimulating the required RGB imaging sequence. It works basically like a laser printer, in which image is being refreshed at a much higher rate. Laser phosphor display is similar to cathode ray tube technology but it activates phosphors using lasers instead of electron gun. It is because of this the laser phosphor displays are never burdened with screen burn-in as compared with traditional display technologies.

The growth in demand of laser phosphor display technology in video wall segment is mainly due to enhanced quality of image, decrease seam appearance, and promote sustainable practices. Laser phosphor technology displays help in providing displays of any shape, size and resolution allowing for innovative dynamic environments. Because the phosphor pixels have no electrical connections, so they do not experience mechanical or electrical failure.

According to this study, over the next five years the Laser Phosphor Display Technology market will register a xx% CAGR in terms of revenue, the global market size will reach US\$ xx million by 2023, from US\$ xx million in 2017.
