Laser Powder is a new generation of color-changing pigments, and its color-changing principle is different from that of chameleons. Rainbows (rainbows) in nature are a phenomenon of light change. When sunlight shines on water droplets in mid-air, the light is refracted and reflected, forming an arched colorful spectrum. The discoloration principle of laser powder is similar to that of Yuhong. It uses laser etching to form a concave and convex structure on the surface of thin metal/compounds. When small flakes with this structure are arranged on the surface, the discoloration phenomenon occurs. Compared with the chameleon, the color of the laser color change is bright and bright, and the color is rich and colorful.
