## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Power and energy meters measure the output of an optical source. They are a necessity in a wide variety of applications in the lab, on the production floor, or in the field, whether the emission is from low-light sources, such as fluorescence, or from high-energy pulsed lasers.

Although power meters and energy meters are available separately, they have also converged as single category instruments—power-and-energy-meters or PEMs—with the development of versatile consoles or displays that can adapt to a variety of different types of optical sensors. The type of sensor determines whether the device measures optical power or energy, typically in watts or joules, respectively. By itself, a power meter measures either continuous wave (CW) or repetitively pulsed sources, and the typical sensors would be either thermopile or photodiode. An energy meter typically measures pulsed lasers, either single or repetitive pulses, and sensors would include pyroelectric, thermopile, or photodiode with circuitry specially designed to measure pulses. Laser power and energy meters play a vital role in quality control, safety compliance, and performance optimization within the laser industry.

The global Laser Power and Energy Meters market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
