## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Laser Resistant Endotracheal Tubes (ETTs) are used to prevent airway fires during laser surgery of the airway. Initially, fires are located on surface of ETT and cause thermal injury to tissues. If the fire burns through to interior of ETT, O<sub>2</sub> and positive pressure ventilation create a blow torch effect, blowing heat and toxic products down into lung. Cuff puncture allowing O<sub>2</sub> enriched atmosphere can also increase chance of fire after laser burst.

The global Laser Resistant Endotracheal Tubes market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
