A laser shield is a device used to protect human eyes and other objects from laser radiation. Lasers produce laser beams with high energy and concentration that can cause visual impairment, burns, or other tissue damage if irradiated directly into the eyes or other sensitive areas. Laser shields are usually made of special optical materials that have the ability to absorb, scatter or reflect laser radiation. When the laser beam is irradiated on the protective cover, the protective cover can weaken or block the energy of the laser, thereby protecting the human eyes or objects behind from being hurt. Laser shields are widely used in many fields, including medical, industrial, military and scientific research. In the medical field, laser shields are often used in laser therapy

and laser surgery to protect the eyes of doctors and patients from laser damage. In industry and the military, laser shields are used to protect operators from laser strikes and radiation. In scientific research, laser shields are often used in laboratory environments to protect researchers and equipment. When using a laser shield, it is necessary to select an appropriate shield according to the power, wavelength and pulse characteristics of the laser. Additionally, laser shields require regular inspection and maintenance to ensure their effectiveness and reliability.
