## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Laser speckle is generated by random scatterers illuminated by coherent light and is therefore a random process, and this speckle is highly random and appears in different patterns with distance. Laser has great potential in the field of imaging, but the problem of 'spot' has always plagued people: when traditional lasers are used for imaging, due to high spatial coherence, a large number of random spots or granular patterns will be generated, which seriously affects the imaging effect. . The Laser Speckle Reducer (LSR) is a dynamic diffuser with its own unique built-in driver. We offer two innovative technology products with their own advantages: Electroactive Polymer Speckle Reducer STOT-LSR and Magnetoresistive Force Speckle Attenuator STOT-LSR. Ideal for removing laser speckle noise. Built-in driver, plug-and-play provides a variety of speckle angles.
