According to our LPI (LP Information) latest study, the global Laser Tab Notching Machine market size was valued at US\$ million in 2022. With growing demand in downstream market, the Laser Tab Notching Machine is forecast to a readjusted size of US\$ million by 2029 with a CAGR of % during review period.

The research report highlights the growth potential of the global Laser Tab Notching Machine market. Laser Tab Notching Machine are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Laser Tab Notching Machine. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Laser Tab Notching Machine market.

The tabs are metal conductors inside the lithium battery that lead out the positive and negative current collectors. Tab forming is a process of cutting conductors on the positive and negative current collectors. It is generally used as a pre-process of winding or lamination. It is one of the key processes in the manufacturing process of power batteries and some consumer electronic batteries.

Traditionally, tab forming has mainly used mechanical die-cutting processes. The mechanical die-cutting process has limitations such as fast mold loss, long mold change time, poor flexibility, and low production efficiency. It is increasingly unable to meet the development requirements of lithium battery manufacturing. Due to the many advantages of laser cutting technology and the maturity of high-power, high-beam-

quality nanosecond lasers and single-mode continuous fiber technology, laser tab cutting has gradually become the mainstream of tab forming technology.
