The laser transverse and longitudinal mode comprehensive experimental system is an experimental device that integrates the observation, analysis and control functions of the laser resonant cavity mode characteristics. It is used to study the transverse mode and longitudinal mode characteristics of the laser output light field and their interaction mechanism. The system realizes the synchronous observation and control of the laser transverse mode (light field distribution perpendicular to the propagation direction, such as TEM₀₀ mode) and longitudinal mode (frequency distribution along the propagation direction, determined by the cavity length) through the design of the geometric parameters of the optical resonant cavity, the introduction of mode selection elements (such as apertures, phase modulators, etc.), and the integration of high-precision spectral analysis equipment (such as scanning interferometers, CCD cameras, etc.). In the experiment, the influence of different resonant cavity structures (such as stable cavities and unstable cavities) on the transverse mode purity and longitudinal mode frequency interval can be analyzed, and nonlinear effects such as mode competition and mode coupling can be explored, and experimental basis can be provided for the optimization design of lasers (such as single-mode output and high beam quality).
