Laser ultrasonic testing (LUT) is a non-contact and non-destructive detection technology that uses lasers as detectors and data readers to detect material defects by detecting internal ultrasonic waves. The basic principle of this technology is to use a laser beam to generate instantaneous thermal expansion on the surface of the material, thereby releasing ultrasonic waves, and then measure the velocity and amplitude of the ultrasonic waves propagating inside the material. By processing and analyzing the

detection signal, information such as the type, shape, size, and location of defects in the material can be determined.

Compared with traditional ultrasonic testing technology, laser ultrasonic testing has advantages such as higher detection sensitivity, higher spatial resolution, and larger detection depth. It is widely used in aerospace, automotive, shipbuilding, power, petroleum, and other fields, as well as material science, manufacturing processes, and safety monitoring.
