The global Laser Ultrasonics Testing System market size is predicted to grow from US\$ 68.18 million in 2025 to US\$ 109 million in 2032; it is expected to grow at a CAGR of 7.1% from 2026 to 2032.

A Laser Ultrasonics Testing System is a non-contact inspection technology used to evaluate the properties and integrity of materials and structures. It utilizes laser-based techniques to generate and detect ultrasonic waves, which propagate through the material being tested. The system employs a laser to create ultrasonic waves at the surface of the material and another laser to detect the waves as they reflect back from internal features or defects. This method provides detailed information on material thickness, density, and the presence of internal flaws without physical contact, making it ideal for inspecting delicate or inaccessible components in industries such as aerospace, automotive, and manufacturing. Its advantages include high precision, the ability to test through various materials, and minimal disruption to the inspected components.
