The Laser Vibrometer Sensor is a high-precision vibration measurement device that uses laser beams to detect and measure the vibration of objects. This sensor usually consists of a laser transmitter, a laser receiver and an optical system. Optical systems include lenses or other optical components that are used to accurately guide the laser beam.

In terms of working principle, the laser vibrometer sensor emits a laser beam through the transmitter. The laser beam irradiates the object to be measured and forms a small light spot on the surface of the object. As the object vibrates, the light spot also vibrates. The receiver is responsible for capturing the reflected laser beam and measuring the intensity changes caused by the vibration of the light spot. By analyzing these changes, information such as the vibration frequency, amplitude, and vibration mode of the object can be accurately obtained.

Due to the high directivity and high monochromaticity of laser, laser vibrometer sensors can provide high-precision and high-resolution vibration data, so they are widely used in fields such as engineering structural health monitoring, aerospace, automobile manufacturing, vibration control, and precision machinery.

The global Laser Vibrometer Sensor market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
