Laser automatic weight removal and balancing machine is a device that utilizes laser technology to achieve automatic weight removal and balancing. This type of device is typically used for rotating components that require high-precision dynamic balancing. The application of laser weight removal in the current field of dynamic balancing machines is relatively small, with a low proportion. Currently, the majority of mainstream weight removal balancing machines still use alloy cutting tools. The equipment cost for using laser to remove heavy objects is relatively high, and most of the heavy objects can be removed using alloy cutting tools. Therefore, laser weight balancing machines are mainly selected when the balance machine using alloy cutting tools for weight removal cannot meet the requirements. Laser weight removal does not produce metal debris when removing metal materials from the rotor, while alloy tool balancing machines will inevitably produce a large amount of debris when cutting metal. Even with the use of a chip removal device, it cannot be absolutely guaranteed that there will be no metal debris left behind. Optical equipment has extremely strict requirements for dust, especially for radars based on optical principles such as LiDAR, so laser weight removal is suitable for this type of workpiece. Therefore, the development of a LiDAR weight balancing machine can effectively meet the requirements of this field.

The global Laser Weight Balancing Machine market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
