Abstracts

The global Lateral Blind Spot LiDAR market size is predicted to grow from US$ 3286 million in 2025 to US$ 12790 million in 2031; it is expected to grow at a CAGR of 25.4% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The current laser radar design on the market mainly solves the problem of forward long-range detection. When the laser radar is installed on the roof, due to the limitation of the vertical field of view, there will still be a long 'perception blind spot' in front of and on the side of the front of the car, which makes it difficult to accurately detect obstacles such as low objects, small animals crossing, and curbs near the car body. For similar situations, when configuring laser radar solutions, car companies need to fully consider the perception needs of specific scenes and functions, and match sensors with different performance characteristics to achieve a better perception system upgrade solution. Therefore, a side blind laser radar designed specifically for near-field perception has begun to attract industry attention. Side blind laser radar is an important support for the perception upgrade of high-level assisted driving systems. It can better support high-level assisted driving functions such as structured road NGP, urban NGP, and parking APA. It is also a necessary sensor for L3 autonomous driving functions such as high-speed TJP/HWP and memory parking, and is widely used in the field of L4 limited scene autonomous driving. From the perspective of perception needs in specific scenarios, side blind laser radar will be able to complement the capabilities with the main laser radar and traditional perception solutions.
