Laue cameras use a technique that exploits back-reflection geometry. A beam of polychromatic low-energy X-rays passes through a detector and a sample on the other side of the detector, which reflects the X-ray beam and forms a set of diffraction spots. These diffraction spots are then recorded directly onto the detector. The indexing of the diffraction pattern is specific for each crystal orientation and allows materials scientists and physicists to grow and then cut crystals with electro-optical properties.

The global Laue Camera market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
