The Laue single crystal diffractometer is a precision instrument that uses the Laue effect of X-rays to analyze the structure of single crystals. It can accurately determine the three-dimensional position and arrangement of atoms in the crystal by detecting the intensity distribution of X-rays scattered from different crystal planes of single crystal samples. It is widely used in the fields of materials science, chemistry, physics, etc. to reveal the microstructure and physical and chemical properties of substances. This technology is particularly suitable for quickly obtaining preliminary structural information of crystals and studying crystal changes under extreme conditions such as high temperature and high pressure.
