The layer insulation folding machine is a device used for folding layer insulation materials. Layer insulation refers to the insulating material used to isolate and protect wires or coils in electrical equipment such as motors and transformers. Folding refers to folding or bending the edge part of the insulation material to enhance its mechanical strength and fixation. The layer insulation folding machine can perform precise folding processing of layer insulation materials through specific processes and mechanical structures. It usually includes components such as feeding device, folding device and control system. The operator puts the layer of insulation material into the machine, and the machine automatically completes the hemming process, folding or bending the edges of the insulation material into the desired shape. The layer insulation folding

machine is efficient, precise and stable, which can improve production efficiency and product quality. It is widely used in motor manufacturing, transformer manufacturing, power electronics and other fields, and is used to process various types and specifications of layer insulation materials to meet the needs of electrical equipment for folding processing of insulation materials.
