The global LCD Color and Black Photoresists market size is projected to grow from US\$ million in 2022 to US\$ million in 2029; it is expected to grow at a CAGR of % from 2023 to 2029.

Color and black photoresist: mainly used for color filters, the quality of photoresist will directly affect the color performance of the filter.

Color filters account for 14%-16% of the total panel cost, while color and black photoresists account for about 27% of color filter costs, with black photoresist accounting for 6%-8%.

For color photoresist, five Japanese companies including Sumitomo Chemical, JSR, Toyo Ink, Mitsubishi Chemical and DNP accounted for 67% of the total market share, and the rest was mainly occupied by Yake Technology and Chimei Industries.

For black photoresists, Japanese companies Mitsubishi Chemical, NIPPON STEEL Chemical & Material, TOK, and ADEKA together account for 70% of the market, and the rest include Daxin Materials and Taiwan Chimei Chemicals.

Photoresist is a light-sensitive mixed liquid. Its components include: photoinitiators (including photosensitizers, photoacid generators), photoresist resins, monomers, solvents and other additives.

In the flat panel display industry: the main photoresists used are color and black

photoresists, LCD touch screen photoresists, TFT-LCD positive photoresists, etc. In the production process of photolithography and etching, photoresist is coated on the surface of the crystal film, and the pattern on the mask (mask) is transferred to the film after exposure, development and etching to form a pattern corresponding to the mask.
