LCD display power supply is an electronic device that provides stable power support for liquid crystal display (LCD) system. It is mainly used to convert the input AC or DC power into multiple sets of voltages suitable for the operation of each LCD module, including logic voltage (such as 3.3V, 5V, 12V) for the main control circuit, bias voltage (such as VGH, VGL, VCOM) for the liquid crystal drive circuit, and constant current or high voltage power supply for the backlight module. This power supply system not only requires high precision, low ripple and high efficiency, but also needs to have multiple protection functions, such as overvoltage, overcurrent, short circuit and overtemperature protection, to ensure the stable operation and long life of the display system. As LCD technology develops towards high resolution and low power consumption, LCD display power supply is also evolving towards miniaturization, high integration and high efficiency.

United States market for LCD Display Power Supply is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
