LCD glass substrate is a generic term for the special glass used for thin-film transistor (TFT) LCDs which form the display area of products including LCD televisions, personal computers and mobile phones. An LCD panel consists of various components stacked in a number of layers. These components include a polarizer, a color filter and a liquid crystal layer, with the glass substrate being the most important. Glass substrates are extremely thin – typically about 0.3-0.7 mm – and 8th-generation glass substrates (2,200 x 2,500 mm) are as large as three tatami mats in size.
