The global LCD and OLED Panel market size is predicted to grow from US\$ 120670 million in 2025 to US\$ 156100 million in 2032; it is expected to grow at a CAGR of 3.8% from 2026 to 2032.

The LCD panel controls the direction of rotation of the liquid crystal molecules through the signal and voltage on the thin film transistor, thereby controlling each pixel to emit polarized light, thereby achieving the purpose of display. The structure of the LCD panel is to place a liquid crystal box in two parallel pieces of glass, set a thin film transistor on the lower glass substrate, and basically set a color filter on the upper glass. Then, the direction of the liquid crystal molecules is changed by the signal and voltage of the thin film transistor, so that each pixel emits polarized light to achieve the purpose of display. At present, this technology is very mature, the market has been popularized, and the price is relatively low. OLED (Organic Light-Emitting Diode) is an organic light-emitting diode, which is a new product on mobile phone OLED. OLED display technology is different from traditional LCD display methods. It does not require a backlight. It uses a very thin organic material coating and a glass substrate (or a flexible organic substrate). When current passes through, these organic materials will emit light. In addition, OLED display screens can be made lighter and thinner, with a larger viewing angle, and can significantly save power consumption.
