## Abstracts

The global LCD Surgical Display market size is predicted to grow from US\$ 3714 million in 2025 to US\$ 5151 million in 2032; it is expected to grow at a CAGR of 4.9% from 2026 to 2032.

A surgical LCD display is a high-performance, medical-grade monitor designed for operating rooms, providing crystal-clear, detailed visualization of endoscopic, laparoscopic, or robotic surgery, patient scans (like X-rays/PACS), and vital signs, featuring high resolution (HD/4K), color accuracy, and durable, easy-to-clean surfaces for critical information during procedures.

In 2024, global production of LCD surgical displays reached 1.194 million units, with an average price of US\$3,046 per unit. Gross margin remained between 35% and 50%.

The LCD surgical display industry chain mainly consists of upstream panel suppliers, backlight module suppliers, specialized imaging chip suppliers, and optical protective glass suppliers. Downstream, it covers hospital operating rooms, endoscopy centers, minimally invasive surgery centers, medical imaging departments, and the construction of surgical platforms for large medical groups. Key upstream materials include high-brightness, high-contrast, and medical-grade color-accurate panels, requiring reliability, corrosion resistance, and the ability to operate continuously for extended periods. Representative upstream companies include BOE, AUO, and Cree, which provide core components in medical-grade LCD panels, high-brightness backlights, and specialized LED light sources, forming the foundation for the imaging quality of surgical monitors. Downstream demand is significantly concentrated in hospitals, particularly departments performing minimally invasive, laparoscopic, robotic, and high-resolution intraoperative image-guided surgeries. Representative end-user institutions include Medtronic Surgical Centers, Stryker Visualization Solutions, and the operating departments of large tertiary hospitals in China. These institutions drive continuous monitor upgrades through

increased surgical volume, improved surgical visualization, and standardized equipment, making downstream the most important driver of industry expansion.

The development trend of LCD surgical displays is strongly driven by the increase in minimally invasive and laparoscopic surgeries, the increasing demand for intraoperative image clarity, and the integration of hospital digitalization with operating room construction. With the maturity of 4K, 8K, HDR, wide color gamut, and low-latency processing technologies, displays have rapidly upgraded from traditional FHD to ultra-high definition, forming deep integration with intraoperative navigation, robotic systems, and AI image analysis, driving the widespread adoption of higher-performance products. Increased requirements for surgical infection control have also promoted the penetration of waterproof, corrosion-resistant, anti-reflective glass, and sterile, easy-to-clean structures. Obstacles include the high price of medical-grade displays, limited procurement budgets, the dominance of international brands in the high-end market leading to temporary limitations on domestic substitution, and cost pressures from price fluctuations in core components such as panels and backlights. Uneven levels of hospital IT infrastructure development across different regions also contribute to variations in penetration rates.
