The global Lead-based Bearing Alloys market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Lead-based bearing alloys are also called lead-based babbitt alloys. It is a lead-antimony-tin-copper alloy, which has moderate hardness, good running-in performance, slightly larger friction coefficient, and low toughness. Mainly used for cables, batteries, etc. A bearing alloy based on lead and antimony. Its microstructure at room temperature is a soft matrix γ solid solution (solid solution of antimony dissolved in lead) distributed with hard point β phase (solid solution of lead dissolved in antimony). In order to improve strength, hardness and wear resistance, 6% to 16% tin is usually added, and 1% to 2% copper is often added to prevent specific gravity segregation. In addition, adding a small amount of arsenic and cadmium can refine the structure and improve the high-temperature hardness of the alloy.

United States market for Lead-based Bearing Alloys is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Lead-based Bearing Alloys is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.

Europe market for Lead-based Bearing Alloys is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
