The global Lead Bismuth Alloy market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Lead-bismuth alloy is an alloy composed of lead (Pb) and bismuth (Bi). It has a low melting point and good thermal conductivity and is widely used in the field of nuclear energy, especially as a coolant and radiation shielding material in fast neutron reactors. Its melting point is usually between 125° and 167°, which is suitable for working in high temperature environments. Compared with other coolants, such as liquid sodium, lead-bismuth alloy is less corrosive and safer to use. In addition, both lead and bismuth are high-density metals that can effectively absorb radiation and protect nuclear reactors and their surroundings.

United States market for Lead Bismuth Alloy is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
