## Abstracts

The global Lead-Calcium Alloys for Storage Battery market size is predicted to grow from US\$ 187 million in 2025 to US\$ 294 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

Lead-antimony alloys for batteries are alloys composed of lead as the base material, with added antimony (generally 2%?7%) and small amounts of tin, arsenic, copper, and other elements. They are primarily used to manufacture the grids and conductive components of lead-acid batteries. Compared to pure lead, they possess advantages such as higher hardness, higher mechanical strength, better fluidity, ease of casting, and corrosion resistance, effectively extending battery life and enhancing structural integrity.

The upstream industry is heavily reliant on non-ferrous metal smelting and recycling. The main raw materials are electrolytic lead, primary antimony, and, in recent years, increasingly important recycled lead (mainly from the smelting of spent batteries). Because antimony is a strategically scarce resource, its price fluctuations and export quotas directly impact alloy costs. Global sales in 2025 were approximately 68,900 tons, with an average selling price of US\$2,782 per ton. The industry's gross profit margin is typically around 10%?15%.

United States market for Lead-Calcium Alloys for Storage Battery is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
