Lead-free solder material is a type of solder used in electronic assembly and manufacturing that does not contain lead, making it safer for human health and the environment. These solders are typically composed of a combination of metals such as tin, silver, and copper (often referred to as SAC alloys), with tin being the primary component. Lead-free solders were developed in response to environmental regulations like the European Union's Restriction of Hazardous Substances (RoHS) directive, which restricts the use of certain hazardous materials in electrical and electronic equipment. Although lead-free solder has a higher melting point compared to traditional lead-based solder, it provides reliable electrical connections and is widely used in modern electronics manufacturing.
