The global Leaded Thermistors market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Leaded thermistors are electronic components that consist of a thermally sensitive resistor encased in a package with leads extending from it. Thermistors are resistors whose resistance changes significantly with temperature variations.

Leaded thermistors are distinct from surface mount devices (SMDs) in that they have wire leads (typically made of tinned copper) extending from the component body. These leads allow for easy insertion into through-holes on a printed circuit board (PCB) or for direct soldering onto the board's pads.

They are commonly used in applications where precise temperature measurement or temperature compensation is required, such as in temperature sensors, thermostats, and temperature-compensating circuits. Leaded thermistors come in various configurations and temperature ranges to suit different operational requirements and environmental conditions.

United States market for Leaded Thermistors is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Leaded Thermistors is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
