The global LECO Silver Paste market size is predicted to grow from US\$ 4382 million in 2025 to US\$ 5665 million in 2032; it is expected to grow at a CAGR of 3.8% from 2026 to 2032.

In 2025, global LECO Silver Paste production reached approximately 2,998 tons, with an average global market price of around US\$1,270 per kilogram. LECO Silver Paste is a kind of conductive silver paste that has significant applications in the photovoltaic field. It is mainly used in the production of high-efficiency solar cells such as TOPCon. Through special formulation and process design, it has excellent conductivity, adhesion, and sintering performance under laser-assisted sintering conditions. It can effectively reduce the contact resistance of the cell and improve the photoelectric conversion efficiency, thus playing a crucial role in enhancing the performance of photovoltaic cells and reducing the power generation cost.

Amidst the large-scale iteration of the global photovoltaic industry toward N-type TOPCon technology, LECO (Laser Enhanced Contact Optimization) silver paste has rapidly ascended from a laboratory innovation to an industry-standard configuration. The current development status of LECO silver paste is characterized by extremely high market penetration. According to 2025 official disclosures from industry leaders such as DKEM and JZNE, LECO-compatible pastes now account for the vast majority of their N-type product shipments. This technology significantly enhances cell conversion efficiency by optimizing the contact performance between the metallic paste and the silicon wafer. Regarding development trends, the market is moving toward 'ultra-low silver content' and 'ultra-fine line' printing, aiming to reduce dependence on expensive silver powder through formula optimization while facilitating deep cost reduction in the metallization process alongside OBB technology.

Development opportunities are primarily driven by the global rigid demand for high-

efficiency modules and the continuous release of TOPCon production capacity. As the LECO process has become a critical 'final step' for efficiency gains, the demand for specialized pastes has exploded. Furthermore, silver paste manufacturers are building stronger technical moats through enhanced R&D collaboration with leading downstream cell manufacturers. However, obstacles remain severe. The primary factor is the violent fluctuation in silver prices. According to annual reports from listed companies, the irrational surge in spot silver prices during 2025 led to significant losses in fair value adjustments, severely testing the capital chains and risk control capabilities of enterprises. Simultaneously, the industry faces risks of inventory depreciation due to rapid technological iterations and the extreme challenges regarding the compositional stability of the paste under high-intensity laser sintering during the LECO process.
