## Abstracts

The global LED Display Test System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The LED display test system is a combination of equipment and software specifically designed to detect and evaluate the performance of LED displays. The system simulates actual usage conditions to test the display's brightness, color uniformity, contrast, refresh rate, grayscale and other parameters to ensure that the screen quality meets the design requirements. The test system usually includes image processing, data analysis modules and sensor equipment, which can quickly detect pixel defects, dark spots, color deviation and other problems in the display. It is widely used in the production and quality control process of LED displays to ensure that the product meets performance standards before leaving the factory.

LED display test systems play a vital role in ensuring the quality and performance of display screens. With the widespread application of LED displays in advertising, stage performances, intelligent transportation and other fields, the requirements for display effects are becoming higher and higher, and the test system provides an accurate means of quality monitoring. It can effectively detect minor problems such as brightness and color deviation, helping manufacturers improve production efficiency and product qualification rate. However, as the size and resolution of display screens continue to increase, the test system also faces the challenges of increased data processing volume and increased detection complexity. Future technological innovations require smarter and more efficient test algorithms and automation tools to deal with these problems.
