The global LED Lamp Aluminum Substrate market size is predicted to grow from US$ 1209 million in 2025 to US$ 1667 million in 2031; it is expected to grow at a CAGR of 5.5% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

An LED lamp aluminum substrate is a specialized printed circuit board (PCB) that uses aluminum as the base material to provide excellent heat dissipation for high-power LED applications. Unlike standard FR-4 boards, aluminum substrates consist of a three-layer structure: a copper circuit layer, a thermally conductive dielectric layer, and an aluminum base layer. This construction allows heat generated by the LED chips to quickly transfer away from the components, enhancing performance and extending lifespan.

These substrates are widely used in LED lighting systems such as bulb lamps, floodlights, automotive headlights, and streetlights. They offer advantages including thermal conductivity, mechanical strength, and lightweight design. Some advanced aluminum PCBs also support multi-layer designs or integration with MCPCBs (Metal Core PCBs) for higher heat load applications.

United States market for LED Lamp Aluminum Substrate is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
