A Leg Compression System is a therapeutic device designed to enhance blood circulation and reduce swelling in the legs through controlled pressure application. The system typically consists of inflatable cuffs or sleeves that wrap around the legs and are connected to a control unit. This control unit regulates the pressure and compression cycles, providing either intermittent or continuous compression. The primary benefits of a leg compression system include improved venous return, reduced risk of deep vein thrombosis (DVT), alleviation of muscle soreness, and enhanced recovery after physical exertion. It is commonly used in medical settings for patients with circulation issues and by athletes for post-workout recovery.
