Lentiviral are vectors that are derived from the virus known as human immunodeficiency virus and is used to transfer gene in the cells, such as mammalian cell and Others. Lentiviruses are used for transfection in non-dividing and actively dividing cell. This acts as an advantage to anOthers type of retrovirus. The lentiviruses fall in the category of a retrovirus. The lentiviral expression system is developed, which can influence the gene of interest. The commercially available lentiviral expression systems are available in combination with tag sequence, reporter gene, promoters and multicistronic vectors are also available for desired protein expression. These vectors are used for research and development purpose recombinant protein expression, protein characterization, in-vitro transcription, and Others functional arrays.

The global Lentiviral Expression Systems market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
