Low-orbit communication satellites, popularly understood, are a new type of communication method. Hundreds or even thousands of small satellites are launched several times to form a satellite constellation in low-orbit. These satellites are used as 'air base stations' to realize the Internet in space. It's like moving a base station to space and letting the satellite's signal cover the ground like a lighthouse beam. Compared with traditional communication based on ground base stations, this is not only a new technical route and service method, but also a supplement to the signal coverage.
